# RIC Weekly Note #7

## Lecture Content

- Localization, Kalman filtering

## Literature

- Chapter 8.1 + 8.2

## Exercises

1. Complete the exercise in the slides (close to the end)
2. Given a differential drive robot with encoders on the wheels, what would be a reasonable state for a Kalman Filter?
3. Describe the system model for the differential drive robot when control inputs are based on odometry (encoders on the wheels).
